Columbia Town Center Schools Study– Appendix A
HCPSS Elementary School Capacity Update - DRAFT – Appendix B
I. Introduction

Each year the Board of Education of the Howard County Public School System (HCPSS) reviews capital planning options and redistricting scenarios through a feasibility study. The annual student enrollment projection is introduced in this report along with scenarios that are intended to provide a comprehensive look at suggested capital additions, renovations, and any attendance area adjustments that are anticipated within the ten-year Capital Improvement Program period. Plans examined in this document may only be implemented through the Board of Education’s approval of both the capital budget and any change to current school attendance areas. This report is the starting point for the annual process of developing the capital budget.

This document makes note of scenarios that may be developed in future attendance area review processes. Full plan assessments will be made in a future report prior to Board deliberation to show how plans compare to the eleven policy considerations in Policy 6010 School Attendance Areas.

This is a planning document and the recommendations presented for review are not final. The conditions which have influenced past enrollment projections may change. New plans may be needed to react to population shifts or new residential development plans. Experience has shown that by presenting this report annually, assumptions and trends can be given consideration on a regular basis and appropriate adjustments can be made to the capital budget or redistricting plans. Redistricting proposals are not certain until approved by the Board of Education.

The projections in this document are presented for each organizational level (elementary, middle, and high) using a format similar to the Adequate Public Facilities Ordinance (APFO) chart. The “pre-measures” chart shows the effect of projected enrollment without new or accelerated capital projects recommended in this report. The “post-measures” chart gives a preliminary view of projected enrollment with these projects factored in. The chart in this document includes capital projects recommended in for the FY16 Capital Budget. If these projects are not approved, other plans must be developed.

The redistricting process includes the following:

**Feasibility Study.** Projects in the Capital Improvement Program that increase student capacity will be tested in the feasibility study with a redistricting plan consistent with stated redistricting policy goals. Plans will be linked within and across organizational levels to form a short- and long-range redistricting plan. The Board of Education will review the plan and set direction, as appropriate, during the capital budget presentations each year. In years where redistricting is anticipated, the Attendance Area Committee will critique the plan, providing review and comment to the Superintendent.

**Recommending Redistricting Plans.** In years where redistricting is planned, staff will refine the goal directed short- and long-range plan based on the most current set of projections that conform to System-Level Process Requirements. The Attendance Area Committee will apply the direction set by the Board of Education, the System-Level
Process Requirements, and the standards and factors in Policy 6010. Staff will make modifications as appropriate. The plan will be presented at regional meetings, critiqued by the public, and adjusted as appropriate.

Board of Education policy standards recommend consideration of redistricting under certain conditions. While these conditions include opening a school or adjusting to some other change, the most likely trigger is when school capacity utilization projections fall outside the minimum or maximum target range of 90–110 percent school capacity over a period of time.

When redistricting is considered, Policy 6010 School Attendance Areas identifies eleven factors to be considered in the development of plans:

1. Educational welfare of the impacted students in both the sending and receiving schools.
2. Frequency with which students are redistricted.
3. Impact on the number of students bused and the distance bused-students travel.
5. The demographic makeup and academic performance of students in both the sending and receiving schools.
6. Number of students to be redistricted.
7. Maintenance of feeder patterns.
8. Changes in a school’s program capacity.
9. Impact on specialized or regional programs.
10. Functional and operational capacity of school infrastructures.
11. Building utilization. (90–110 percent where possible)

Capacity utilization over time and the number of students redistricted are often given the most attention. The other factors are emphasized to different degrees. The distribution of enrollment growth and capacity is never perfect, so it can be difficult to make plans that satisfy all factors and move few students.

**Approving Attendance Area Adjustments.** In years where redistricting is occurring, the Board of Education will schedule public hearing(s) in accordance with Policy 2040 Public Participation in Meetings of the Board of Education on the proposed attendance area adjustments. Their deliberations will also include a public work session(s) with staff and the members of the Attendance Area Committee.

**Assessing the Process.** In years where redistricting is occurring, the Board of Education will assess the process at the end of the redistricting cycle. Modifications will be made as appropriate prior to the beginning of the next cycle.

After the feasibility study has introduced the new projection, tested redistricting scenarios, and recommended capacity adjustments, the capital budget is prepared. In years where redistricting is occurring, the capital budget and redistricting processes run in parallel, as illustrated in Figure 1.
II. Executive Summary

This feasibility study forms the basis for the development of the Capital Improvement Program (CIP). In September 2014 the FY 2016 Superintendent’s Proposed Capital Budget will be presented, which includes the five-year CIP. The following sections highlight staff considerations included in this study which may be included in the CIP.
A. Capacities

The additions and new schools approved as part of the FY 2015–2024 Long-Range Master Plan are included in the assumptions for this document, including the plan to replace Wilde Lake MS with what will be the first Net Zero Energy school in Maryland. Construction of Thomas Viaduct MS is nearing completion and will open this August within the Oxford Square development.

Longer term projects are also included in the assumptions. For instance, the 100-seat addition at Waverly ES is to be funded in FY 2016 to help manage growth in Ellicott City from Turf Valley. The replacement of Wilde Lake MS will be critical to help manage growth in student enrollment stemming from the Columbia Town Center development. Elementary School #42 is a high priority need to address future growth in both the Northeastern and the Southeastern Regions, and should be considered for acceleration. This study validates the need for all of the projects recently approved in the long-range plan. Looking ahead to the next capital budget, three considerations are recommended for the FY 2016–2025 Long-Range Master Plan:

- Dunloggin MS Renovation – Growth will continue in the Dunloggin MS attending area and future relief by redistricting appears to be unlikely. A future renovation project is scheduled for planning funding in FY 2016. An addition should be planned as part of the project to allow for construction swing space and to provide additional capacity.
- Ellicott Mills MS – During the middle school redistricting, relief for Ellicott Mills MS was deferred because it could not be accomplished with Thomas Viaduct MS. During the Attendance Area Review, scenario analysis indicated that western redistricting may not be viable and that expansion may be advisable. The newly approved middle school capacities provide context for a possible expansion of Ellicott Mills MS. Both Mayfield Woods MS and Mount View MS are now rated at nearly 800 seats. A feasibility study should be conducted to review the options for an expansion of 150 seats and should include consideration of any necessary core facility adjustments along with additional classrooms.
- Elementary School #42 – Accelerate construction timeline for completion in August 2018.

Since the new general plan and subsequent comprehensive zoning was approved, new development is pending which was not anticipated in the FY 2015 Long-Range Master Plan. In comparison to last year’s projection, future housing has been increased by almost 1,000 units. The HCPSS has built facilities and redistricted to use existing capacity to serve development projections prior to these approvals. In the interim, relocatable classrooms provide the short-term capacity to allow schools to operate as intended, but they will not open areas to new residential growth. In future capital budgets, the county can invest in the additional infrastructure needed to support the increased residential growth allowed for in the general plan and comprehensive zoning.
B. Redistricting Approach

It is our goal to use redistricting as infrequently as possible, moving as few students as necessary within the constraints listed in Policy 6010 School Attendance Areas. In the 2013 Feasibility Study staff recommended taking a break from redistricting in 2014 to further assess the process and evaluate the long-range plan. Redistricting is not recommended for the Board of Education to consider this fall. Future redistricting was already proposed and analyzed in previous feasibility studies and will be revisited in future feasibility studies. The Board of Education followed up on the recommendation to pause from redistricting by budgeting funding for a consultant study. The amount of time we can delay longer-term redistricting is linked to the rate of crowding in specific areas like the Manor Woods ES or Howard HS attending areas.

C. Recommendations

1. **Do not convene an Attendance Area Committee in 2014.**
   The June 2013 Feasibility Study discussed the need for a pause in the redistricting process in 2014 to allow for the evaluation of planning alternatives. The Board of Education calendar was approved on January 23, 2014, without the inclusion of redistricting hearings and work sessions for this fall.

2. **Consider options and provide direction for the consultant review.** The scope of the request for proposal is presented in this document. These include:

   - Review Enrollment Projection Methodology
   - Recommend enrollment projection benchmarks
   - Evaluate Feeder System
   - Consider Redistricting Alternatives
• Evaluate FARM Rates
• Evaluate Scenario Testing Tools
• Develop New Scenario Testing Tool

3. Accept the Columbia Town Center Schools Analysis findings.
   The key findings of this plan are as follows:
   • The study uses a modified projection and concludes that there are capacity
     needs at all three levels.
   • Receiving the donation of the Clary’s Forest site\(^1\) is recommended.
   • A concept of converting additional projected land needs into future building
     space is discussed. This allows consideration of future needs within new
     downtown development.

4. Long-term planning is needed for additional capacity.
   Quality schools build strong communities. While the HCPSS is peripheral to land
   development discussions, staff continues to work closely with Department of Planning
   and Zoning and Public Works staff to ensure that schools are central to new
   development.

   The HCPSS continues to actively pursue land acquisition opportunities for school sites
   in the eastern part of the county, including one large enough to accommodate a high
   school. This study continues to affirm the need for another elementary school in the
   east for 2018. Experience has shown that obtaining sites is difficult, so a site should
   be added to the land bank this year. Other sites should be obtained to provide
   maximum flexibility for future capital needs.

   The FY 2015 Capital Budget reflects projects that were first mentioned in this report
   last year. Many of the long-term trends evident in this report were identified in
   previous years. Projections indicate the need for an additional elementary facility to
   support growth from the Columbia Town Center development in the next decade.
   Projections continue to support the need for elementary redistricting to relieve
   overcrowding at Manor Woods ES associated with Turf Valley growth. The planned
   2017 addition at Waverly ES can maintain target capacity utilization until 2020,
   including the new attending area added in the 2013 redistricting. Considering the
   limited potential for expanding schools outside of the sewer service area, a Turf
   Valley school site should be obtained.

---

\(^1\) Lot 147 on Plat number 305A-1051 recorded 4/21/1989 and identified in the notes as a school site.
III. Planning Considerations

This section identifies planning assumptions and considerations. The annual projection is developed with assumptions about enrollment growth that have evolved over the years. Other planning considerations involve implications for capital facilities. Some of the previous planning assumptions have been adjusted, while others have been added for this study. This section presents a discussion of the major components and adjustments included in this year’s planning considerations.

A. Projections

Projections used for this study were generated in the spring of 2014. The projection model and methodology used by the HCPSS is based on historic cohort survival ratios—the number of students that “survive” from one grade level (cohort) to the next. Then the effects of new housing yields and the net effects of resale of existing housing stock and apartment turnover are added to the projection. Using the births and actual enrollment data history\(^2\), these variables are combined to project the total student enrollment at each school for September 30 of each future year. The projection is presented out to 2025 in this document, although it extends further into the future. It should be noted that the trends shown after the first five or six years are less reliable; however, certain decisions like site acquisition are appropriately informed by the later part of the projection.

Planning issues can become apparent by examining the consistency of the current projection to those made in previous years. When several years of enrollment projections are graphed, the basic trends are consistent in each of the projections. By using a ten-year series, these three consecutive annual projections share some years of data. This brings stability to the projection, but still allows the projections to indicate differences so that changing trends can be apparent.

As shown in Figure 3, the 2014 projection is showing stronger enrollment growth at the elementary level. Most of the enrollment growth comes as “survival,” meaning the system is gaining new students in the transition from one grade to the next. The trend in the 2014 projection is for elementary enrollment to increase by 3,912 students by 2023. As a result of this enrollment growth, the capacity utilization of all elementary schools combined will begin to exceed 110 percent by 2020. This is earlier than previous projections and may suggest that adjustments are needed to the long-range capital improvement plan. Projects approved as part of the FY2015 CIP can absorb some of this growth.

The trend in the 2014 projection is for middle school enrollment to increase by 2,855 students by 2023. As a result of this enrollment growth, the capacity utilization of all middle schools combined will begin to exceed 110 percent beyond 2021. Most of the projected growth is in the east, and projects approved as part of the FY 2015 CIP can only partially absorb this growth.

\(^2\) A five-year series, in this case September 30, 2009, through 2013 enrollments, is used in the projection.
The trend in the 2014 projection is for high school enrollment to increase by 4,945 students by 2023. This represents a stronger trend than in previous years. As a result of this enrollment growth, the capacity utilization of all high schools combined will begin to exceed 110 percent by 2018. Based on the long-term growth trends, land should be banked for future needs in the vicinity of the Northeastern Region.
The graphs on the left consider the elementary, middle, and high school projections for this year in comparison to the projections made for 2012 and 2013.

These overall depictions of the projection by level help to show general relationships in trends.

The 2014 projection appears to show stronger long-term enrollment growth at all three levels.
When developing the annual projection, School Planning staff reviews the differences between previous projections to determine if data inputs were correct or if any assumptions should be reconsidered. Projections are simply an organized way of making assumptions based upon available data. Differences between projections can be explained by variations in input data from year to year. Specific contributing factors to differences between projections include:

1. **Changes in Development Horizon.** Each year the Department of Planning and Zoning provides a housing projection for each school. New approvals or changes to phasing of existing projects can alter the timing and intensity of growth at specific schools. As previously noted, approximately an additional 1,000 units were included to account for the general plan and comprehensive zoning effect.

2. **Difficulty Projecting Kindergarten.** Kindergarten is typically the most difficult grade to project because the time between the data point (birth) and enrollment is five years as opposed to one for all other survival ratios.

3. **Changing Housing Yields.** Lower elementary pupil generation will likely continue in the west. While most future housing in that area will be single family detached, environmental restrictions will limit supply, leading to larger more expensive homes. Higher housing yields continue to be observed for multi-family units. This impacts the northeast and southeast where many such units are under construction and more are anticipated. Individual projections for each school help to capture local effects.

4. **Changes in Cohort Survival Ratios.** With each new data set, the newest survival ratio is added to the five-year historical base and new historical average results. The new average is then amplified throughout the model, meaning the projection, over time, can be sensitive to a relatively small change in the survival ratio. The more immediate impact to projected enrollment is the initial size of the cohort.

5. **Changes at Feeder Schools.** If enrollment in an elementary school feeding a middle school increases or decreases, the effect can be magnified at the middle school, particularly if several feeder schools change in the same direction. The size of the outgoing cohort may also have an impact.

**B. Capacities**

Capital planning and Adequate Public Facilities Ordinance (APFO) regulatory review of development depend upon accurate capacity assessments and sound projections to derive capacity utilization projections. Capacities of schools dictate the calculation of capacity utilization percentage. The final phase of the HCPSS Elementary School Capacity Update review is underway and will determine whether any further changes should be made to elementary capacities. Appendix B includes draft analysis for Running Brook ES and Forest Ridge ES. The draft results indicate that while small changes are warranted, they

---

3 Capacity is only relevant to APFO at the elementary and middle level. There is no high school capacity test.
will have little impact in the regions of greatest concern. It is expected that the complete report will be presented to the Board in September for their review.

C. Regions

This study presents school information in six regions. The regions were originally designed to correspond to planning regions used by the county. As new facilities have been built, the school planning regions were not adjusted. The service areas of the six regions do not match up by level—elementary, middle, and high. This disconnect has not been a problem for developing projections and redistricting scenarios because modeling is done at the school and planning polygon level, with the results then summed for regions.

The Howard County Department of Planning and Zoning has not needed HCPSS regions to align with their planning areas. The Adequate Public Facilities Ordinance Housing Unit Allocation charts allocate units based upon fixed planning areas. When new developments are proposed, the Adequate Public Facilities Ordinance School Test (elementary and middle) is based upon whether the assigned schools are open or closed. A region test is made at the elementary level only. The law closes a region to development if capacity utilization for the region exceeds 115 percent, even if the assigned elementary school does not exceed 115 percent. This condition is projected; however, by the time this condition occurs, it is likely the HCPSS will have taken steps to address the enrollment growth by building new capacity or redistricting.

The school regions remain important in making comparisons and discussion of the impact of real estate trends on student enrollment in different areas of the county. The regions serve a general purpose for identifying trends but staff can re-aggregate data in several logical groupings of schools to study specific matters. A recent example is the evaluation of impacts to schools from the proposed development of Downtown Columbia.

D. Capital Planning and Sewer Service Area

Some HCPSS facilities are outside of the sewer service area and require on-site treatment systems. While the systems currently in place are well designed and maintained, there is no guarantee that future requirements for discharge will not be more stringent. For this reason, staff now considers new sites that would require on-site waste treatment to be a significant cost consideration. Future capital planning will seek to locate new or replacement schools on sites that have access to public sewer. This strategy is consistent with the Maryland Smart Growth Act and the Howard County General Plan which both direct new residential growth into Priority Funding Areas within the sewer service area.
E. Land Bank

The HCPSS maintains a bank of sites\(^4\) for future school construction. For many years, most of the land bank consisted of school site reservations that came out of Columbia planning and development. Approximately 67 acres of land remain in reservation. Howard County has aided the school system in the past through exchanges of county land where needed. Opportunities for additions to the land bank in eastern Howard County are under consideration. An elementary school site is also sought to accommodate Turf Valley development. The HCPSS will continue to reach out to local and state agencies as it searches for additional sites along the Route 1 Corridor and other areas of identified growth. To this end, the efforts of Howard County Government staff have been greatly appreciated. A full inventory of school sites is presented annually in the capital budget.

IV. Needs and Strategies

Prior to examining future redistricting plans, it is necessary to review the implications of the new projection and identify needs and potential strategies. When school capacity utilization is outside of the acceptable range (90–110 percent), redistricting may be considered.

A. Elementary School Section

Elementary redistricting has been completed for the Northeast and Southeast Regions and Duckett’s Lane ES is now open. Most schools in these regions have been balanced by these changes, but several, including Bollman Bridge ES, Duckett’s Lane ES and Forest Ridge ES, will need relief within the next five years or earlier. The construction of Elementary School #42 should be accelerated if possible.

A surplus of capacity will remain in the Western Region due to lower than anticipated pupil generation rates and larger facilities. Some of this capacity was used to provide relief to the Southeastern Region in a redistricting approved in November 2011. The three areas which will experience the greatest growth over the next five to ten years will be the Route 1 Corridor, Columbia Town Center, and Turf Valley.

The HCPSS Elementary School Capacity Update is underway and will determine whether any further changes should be made to elementary capacities. Draft examples for Running Brook ES and Forest Ridge ES are included as Attachment B. The draft results indicate that while small changes are warranted, they will have little impact in the regions of greatest concern. For example, Running Brook ES is currently rated at a capacity of 405 students. When the construction of the addition is completed in August 2014, using the same methodology that was used as part of the middle school capacity review, the student capacity could be changed to 515, an increase of 10 over the projected CIP capacity of 505. Even with this change, the school would still be projected to reach 110 percent of capacity by 2016 in this projection.\(^5\) Similarly, Forest Ridge ES is currently rated at a

\(^4\) The land bank is listed in the Capital Budget, in Appendix E on page 74.

\(^5\) The Board recently approved an APFO open and closed chart based upon the June 2013 projection. The testing year for showing schools closed if they exceed 115% is 2017. Running Brook is shown closed on this chart with a 505 seat capacity. If the capacity were increased to 515, the closure would occur in 2018.
capacity of 626 students, but could be increased to 644 students, an increase of 18. Even with this change, the school would still be projected to reach 110 percent of capacity by 2016. The draft analysis is included as Appendix A to this report. It is expected that the complete report will be presented to the Board in September for their review. Regardless of the outcome of that action, a combination of new schools and redistricting in some form will be required to contain the rapid student enrollment growth HCPSS will be experiencing over the next five to ten years.

**Columbia East Region**

**Need:**
None in short term.

**Strategy:**
Monitor enrollment projections in future studies.

The schools in this region will substantially remain within target as a result of approved redistricting and capital projects which have recently been completed at Thunder Hill ES, Phelps Luck ES, and Stevens Forest ES.

**Columbia West Region**

**Need:**
The region exceeds 110% by 2020 in this projection, ultimately requiring the need for an additional elementary school in the next decade.

**Strategy:**
Provide interim capacity with an addition at Running Brook ES. Maintain Faulkner Ridge site. (Additional detail in Columbia Town Center School Analysis – Appendix A)
Investment in a 100-seat addition at Running Brook ES, which is planned to open this August, has been a key capital project for managing growth in this area. Even with this addition, Running Brook ES is expected to exceed 110 percent utilization by 2016. A 100-seat addition is also planned at Swansfield ES and will open in 2018. Some combination of additional capacity and redistricting will be required to accommodate growth in the area. A redistricting strategy alone, which uses schools that are reasonably nearby, will not provide an adequate solution to accommodate the projected growth. Faulkner Ridge Center, previously used as a staff development and training facility, was closed on July 1, 2011. This site should be retained for redevelopment as a future school.

**Northeastern Region**

**Need:**
There is adequate capacity in this region until 2017.

**Strategy:**
Consider opening Elementary School #42 earlier than 2019.

Capacity utilization at Ducketts Lane ES, which opened August 2013 in the northern Route 1 corridor, will exceed 110 percent utilization next year. We have known for some time that a second new elementary school in the eastern part of the county is needed. The region will exceed 115 percent utilization in 2018 and require close to 1,000 additional seats. The recently completed comprehensive zoning increased the entire housing projection this year by 996 units, most of which was in the east. Advancing the construction of Elementary School #42 to allow opening in 2018 should be considered.
Northern Region

Need:
Manor Woods ES requires relief as soon as 2015. Growth at St. John’s Lane ES must be monitored.

Strategy:
Completion of the Waverly ES addition and construction of a new elementary school later in the decade in Turf Valley.

In the years 2015 and beyond, Manor Woods ES is projected to be above the 110 percent capacity utilization standard and eventually trends above 200 percent, a condition which has varied depending upon the timing of the Turf Valley development. A key feature of capital planning for this development is the Phase II addition at Waverly ES. Constructing this addition in 2017 can help relieve overcrowding at Manor Woods ES. A new elementary school in Turf Valley that is sized to the current educational specifications is needed after 2020 and could serve as a replacement for West Friendship ES. Much of the territory for existing schools will be bused regardless of the school assignment, but a Turf Valley school could have an assigned walk area (HCPSS does not currently own a site within the Turf Valley development).

Southeastern Region

Need:
Future enrollment growth is projected, primarily at Bollman Bridge ES and Forest Ridge ES.

Strategy:
Obtain a site for the land bank. Consider opening Elementary School #42 earlier than 2019.

Schools in the region, with the exception of Forest Ridge ES, are projected below 110 percent utilization at the start of this coming school year. Growth at Forest Ridge ES was
anticipated since it will contain some of the growth that will later comprise the Elementary School #42 attending area. Temporary capacity has been provided and more may be used in the near future. Growth continues in the region, supporting the opening of the next elementary school which is currently planned for 2019.

Western Region

**Need:**
More fully utilize capacity in the Western Region.

**Strategy:**
Monitor projections.

Elementary capacity in the Western Region exceeds need. Twelve years ago, overcrowding in western elementary schools was significant. The September 30, 2000, enrollment report indicated that the region was at 120 percent capacity utilization. The construction of Dayton Oaks ES, the replacement of Bushy Park ES and lower enrollment trends for the region have lowered the overall capacity utilization, which is now approaching 70 percent for the region. The projections which preceded the construction of the new Bushy Park ES and Dayton Oaks ES anticipated larger pupil generation rates than the existing housing stock has produced. West Friendship ES has consistently shown declining enrollment in recent projections. The school operates with a septic system outside the sewer service area and could eventually be subject to more stringent requirements which may require expensive upgrades.

Previous studies have examined the possibility of closing West Friendship ES and using existing capacity in the short term. This idea was set aside last fall to be examined in the context of a future new school, likely in the Turf Valley development and within the sewer service area.

B. Middle School Section

To avoid unnecessary redistricting, save funding and calculate building utilization based on the most accurate facility data available, a middle school capacity study was conducted. These projections support the approved middle school capacity adjustments and the effort invested in redistricting. The study more accurately rated school capacities. Specifically, properly sized classroom space that was previously uncounted was realized,
and undersized space was discounted from the calculations to develop a more realistic capacity for each of the schools. Redistricting planning was based on the revised capacities. With these findings, some planned expansions can be contemplated both in the context of a systemic capacity adjustment and redistricting findings. For this reason, adjustments to the CIP are recommended for Dunloggin MS and Ellicott Mills MS.

Without the new Thomas Viaduct MS and associated redistricting, some schools in the Northeastern and Southeastern Regions would have remained over-utilized, while others remained under-utilized. For example, Murray Hill MS capacity utilization was reduced from 138.5 percent to 97.3 percent and Bonnie Branch MS from 119.5 percent to 96.8 percent with redistricting alone.

</table>

At the countywide level, middle school capacity utilization reaches 110 percent in 2021. While it is possible to balance all schools countywide, the challenge has been that the capacity and enrollment growth do not share the same geography. The Columbia West Region exceeds 110 percent capacity utilization by 2020 and the Northern Region exceeds 110 percent by 2018. The Western Region is within acceptable levels but there are specific schools exceeding policy targets. The Columbia East Region has surplus capacity. The later years of the projection seem to indicate the need for more capacity within the long-range plan and should be monitored in future planning analysis. Presently the projection supports acquisition or development of additional school site options in the Route 1 corridor through agreements with other agencies or developers.
Columbia East Region

Need:
Some capacity exists in this region.

Strategy:
Monitor long-term needs.

Lake Elkhorn MS has some available capacity for the foreseeable future which is why it received a portion of the Patuxent Valley MS attending area in redistricting approved this past year. Oakland Mills MS is also in target for many years.

Columbia West Region

Need:
Enrollment exceeds 110% of regional capacity.

Strategy:
Utilize temporary capacity until the replacement school is built at Wilde Lake MS in 2017.

The Columbia West Region capacity utilization is now above 110 percent. This supports the decision to replace Wilde Lake MS, a project which is scheduled to begin in 2015. The new school is planned to be 234 seats larger than the existing one, and will stay within target utilization until 2019 based on the current projection.
Northeastern Region

Need:
Enrollment growth will continue less dramatically than was projected in previous years.

Strategy:
Long-term growth trends in this region are much more favorable with the opening of Thomas Viaduct MS this August. Future needs in the next decade will be monitored.

All middle schools in the region will be relieved of overcrowding by the opening of Thomas Viaduct MS, except Ellicott Mills MS. Relocatable classrooms will be required until an alternative solution is implemented.

Northern Region

Need:
Enrollment exceeds 110% of regional capacity after 2020.

Strategy:
Monitor long-term needs.

In the years beyond 2020, the Northern Region is projected to be above the 110 percent capacity utilization guideline. Dunloggin MS and Patapsco MS are scheduled for systemic renovations in the next few years. Additional capacity should be considered as part of these renovations or the use of temporary capacity may be needed. When continued growth in the adjacent Northeast Region is factored in with the needs of this region, the land bank site on Marriottsville Road will probably be needed to serve as a future middle school.
Southeastern Region

Need:
Significant enrollment growth has been alleviated with the opening of Thomas Viaduct MS this August. Available capacity in this region, as well as adjacent regions, is not sufficient to absorb long-term projected enrollment growth.

Strategy:
Long-term growth trends in this region should be monitored.

Murray Hill MS and Patuxent Valley MS are projected to exceed 110 percent capacity utilization in 2018. The region will exceed 110 percent utilization in 2019 and enrollment will continue to gradually rise for the foreseeable future. Projected needs beyond this time period will be monitored.

Western Region

Need:
Some capacity exists in this region.

Strategy:
Monitor long-term needs.

Capacity utilization in the region remains within targets throughout the projection. The use of the Marriottsville Road site for a new western middle school will ultimately serve to relieve the Northern and Columbia West Regions.
C. High School Section

Countywide high school capacity utilization meets policy targets until 2018. While the capacity exists to balance all schools countywide, the challenge has been that the capacity and enrollment growth do not share the same geography. The Northeastern Region, comprised of Howard HS and Long Reach HS, will likely exceed 110 percent capacity utilization this fall. The Western Region includes Reservoir HS which is projected to exceed 110 percent capacity utilization by 2018. In the long-term (after 2020), a new high school can be supported in the Northeastern Region and there are additional needs in the Southeastern Region. Preparations are being made to augment the land bank with a site large enough for a high school. This site will be somewhat central to the two regions. The capital budget has been adjusted to show a high school in the next decade.

Columbia East Region

Need:
Some capacity exists in this region.

Strategy:
Consider using capacity to help accommodate Route 1 corridor growth.

The Columbia East Region high school is Oakland Mills HS. Capacity exists at this school for the foreseeable future. Capacity may be utilized to relieve the Northeastern Region, which includes Long Reach HS and Howard HS. Long-term planning discussions are likely to be framed by future additions to the land bank.
Columbia West Region

Need:
Capacity utilization is below 110% for Wilde Lake HS until 2020, the one school in this region.

Strategy:
Monitor projections and only redistrict into this region if absolutely necessary.

The Columbia West Region high school is Wilde Lake HS. The projection for this school remains between 90–110 percent utilization until 2020. With only a few classrooms of remaining capacity, plans to redistrict students into Wilde Lake HS should be avoided unless absolutely necessary. This projection models the effect of the Columbia Town Center development without the adjustment presented in the addendum. Adequate capacity exists to accommodate growth at Wilde Lake HS until 2020.

Northeastern Region

Need:
Significant enrollment growth is projected. Available capacity in this region is not sufficient to absorb long-term projected enrollment growth.

Strategy:
Evaluate capital planning options of additions and acquisition of a future school site.

Howard HS and Long Reach HS serve the Northeastern Region. Howard HS already is exceeding 110 percent utilization. This fall the region will likely exceed 110 percent capacity utilization and the trend is expected to steadily worsen through the projection, exceeding 120 percent by 2016. The school system has added additional temporary
capacity, the best strategy at this time. The installation of a temporary wing at Howard HS is one possibility, but there are site constraints. The movement of regional programs has not been recommended. Space on the campus is confined so a large modular building would make more efficient use of space.

Long-term planning discussions will be framed by the addition of a high school to the land bank. In the meantime, a number of interim strategies remain worthy of further discussion. Redistricting between Howard HS, Long Reach HS, and Oakland Mills HS in 2016 has been presented in previous reports as an interim measure for capacity relief. Other more comprehensive redistricting plans may be considered. Oakland Mills HS represents the closest interim option for capacity relief; however, it can only provide about 150 seats. This is noted in the chart on page 36 and the high school maps for capacity use in 2018; however, the entire system will reach 110 percent capacity in that year in this projection. Previous discussions which looked at the best locations for regional programs and minor changes to school capacity should be revisited. Regardless, these interim measures will not forestall the inevitable need to build a new high school after 2020. For this reason an acquisition to the land bank is planned to include a site large enough for a high school. This site should be somewhat central to the two regions. The capital budget has been adjusted to show a high school in the next decade.

**Northern Region**

**Need:**
Capacity needs in the region have been addressed with the expansion of Mt. Hebron HS.

**Strategy:**
Monitor long-term needs.

The Northern Region has balanced capacity utilization for most of the projection. Centennial HS and Mt. Hebron HS will need to be monitored given the projected utilization above 110 percent after 2019. Capacity remains at Marriotts Ridge HS for this region.
Southeastern Region

Need:
Capacity is adequate through 2021.

Strategy:
Monitor long-term needs.

The Southeastern Region exceeds 110 percent capacity utilization in 2019 and steadily increases later in the projection. The existing facility is matched to projected growth within most of the long-range planning period, but future growth supports the recommendations of banking a high school site and adding plans for a facility to the long-range plan.

Western Region

Need:
Relief is needed at Reservoir HS after 2018.

Strategy:
Monitor long-term needs.

The Western Region does not exceed 110 percent capacity utilization, and no redistricting or major capital planning appears to be necessary through most of the decade. Reservoir HS and Atholton HS should be monitored because this projection indicates they will exceed 110 percent utilization. Atholton HS capacity should also be re-evaluated at the
end of the renovation next year. Some areas of the Reservoir HS attending area are part of the Route 1 corridor; eventually this growth may be addressed with a new high school.

V. Foreseeable Redistricting

This report does not recommend any redistricting for the 2015-2016 school year.

A. Elementary School Redistricting

The June 2012 Feasibility Study offered a plan for elementary redistricting changes that may be considered again for implementation in 2017 (Table 2 includes this scenario). The timing and nature of the redistricting required may change depending upon the timing of the completion of the Waverly ES project. Any plan will need to consider utilizing available Western Region capacity at Bushy Park ES and Triadelphia Ridge ES. Ultimately a new school will need to be built in Turf Valley.

Advancing the construction of Elementary School #42 will allow relief of Ducketts Lane ES prior to projected student enrollment breaking the 1,000 student barrier in 2019. Any redistricting plan would involve a combination of schools including Bollman Bridge ES, Ducketts Lane ES and Forest Ridge ES. Table 2 illustrates one possible scenario for testing purposes only.

B. Middle School Redistricting

The opening of Thomas Viaduct MS has eased the near term crowding concerns in the Route 1 corridor. As the next decade approachess continued growth in all areas of the county will need to be addressed, with the exception of the west. By 2020, the entire school system at the middle school level is projected to exceed 110 percent capacity utilization. These needs will be reexamined in future feasibility studies as new capital projects are added to the CIP.
C. High School Redistricting

Redistricting between Howard HS, Long Reach HS, and Oakland Mills HS in 2016 was presented in previous reports as an interim measure for capacity relief. It is likely that the review of the current redistricting process may generate different options and alternatives than those previously presented. Long-term planning discussions are also likely to be framed by future additions to the land bank and planning for a future high school.

VI. Scoping Consultant Study

A. Purpose

In the review of the FY 2015 Operating Budget, the Board of Education added a $100,000 initiative entitled, “School Planning Policy and Methods Study including Capacity Analysis.” The study is intended to explore alternatives other than the traditional methods of redistricting, including ideas such as open enrollment. The study is also intended to review the current projection methodology, including the use of polygons.

B. Specific Research Goals

Review of Enrollment Projection Methodology – Evaluate and report on the accuracy of current projection methods. Provide comments on where the method could be improved.

Broaden the System’s Perspective with Benchmarking – Staff believes the enrollment projection methodology has been serving HCPSS well, but information to put the system’s experience in context with other school systems is limited. Develop benchmarking presentations which can be repeated each year with the accuracy report.

Evaluate Feeder System – Evaluate best practices and recommended strategies for moving towards a strong feeder system and recommend a strategy.

Consider Redistricting Alternatives – Evaluate best practices for avoiding redistricting. Review strategies for making use of existing capacity in the west outside of traditional “domino-effect” redistricting plans.

Evaluate Income Disparity among Schools – Evaluate current income distribution using measures such as FARM. Consider a strategy for redistribution of income using
redistricting. Compare this strategy to in-school augmentation strategies like the Elementary Model School initiative.

**Evaluate Scenario Testing Tools** – Review the method HCPSS currently uses for testing redistricting scenarios and provide an evaluation of the effectiveness of this method and compare to tools used in other jurisdictions.

**Develop New Scenario Testing Tool** – In light of any recommended changes develop a new scenario testing tool. Develop a new scenario testing tool utilizing ArcGIS.

### VII. Maps

On the following pages six maps illustrate projected growth. The theme of these maps is the effects of capital project and redistricting changes discussed in this report. Conditions in 2018 are modeled with and without these changes for all levels. Specific redistricting plans are not presented, but the trends suggest future redistricting.

In an effort to make the planning process have a transparent and to provide context for the capital budgeting process, specific long-term redistricting plans have been presented in previous feasibility studies. This document does not because plans for future years may require further adjustment from past feasibility studies. Adjustments to the CIP and other recommendations to be adopted after the consultant study. These will be reviewed in the 2015 feasibility study.
Elementary School Effects 2018
- ES #42 in 2019
- No redistricting with Waverly addition

Preliminary analysis to be developed in future Feasibility Studies

- Redistricting from Howard HS
- No Capacity Changes

Preliminary analysis to be developed in future Feasibility Studies
VIII. Pre- and Post-Measures

The effect of staff-proposed plans on capacity utilization are depicted in tabular form on the following pages. The recommendation in this document is presented for each organizational level (elementary, middle, and high) using a pre-/post-measures format. The pre-measures format shows the effect of projected enrollment without any redistricting. The pre-measures format also shows FY14 capital projects as approved. The post-measures format shows the impact of projected enrollment within a redistricting plan. The post-measures format includes capital projects recommended in this document for the FY15 Capital Budget (as shown in Figure 2). If these projects are not approved, other plans must be developed.

I. Introduction

In February 2010, the Howard County Council adopted a General Plan Amendment for Downtown Columbia, also known as the Downtown Columbia Plan. In the two years preceding adoption, the review of this plan included discussion about the need for schools. Student yield analysis studies based on existing apartment and condominium (condo) buildings in Howard County showed that there would be some need, but also raised questions about whether students generated from future housing in Downtown Columbia would occur to the same extent given that the type of planned housing there (new high rise apartments and condos in a mixed use environment) is unique and doesn’t currently exist in Howard County.

The adoption of this plan came when the HCPSS had only just begun the process of realigning the long-term capital facilities plan and redistricting to respond to growing needs in the eastern part of the county. The HCPSS had just opened facilities in the west (Bushy Park ES) and northeast (Veterans ES). The only new planned capacity in the east at that time that was not associated with the full-day kindergarten mandate was the expansion of Elkridge ES. Planning for expansion of Bellows Spring ES was in discussion. Incorporating Downtown Columbia growth into future capital plans would require consensus about the anticipated impact of that growth.

The planned revitalization of Downtown Columbia intends to bring mixed-use development to Downtown in the form of six neighborhoods. The residential element of these mixed-use neighborhoods will consist of 5,500 new multi-family residential units, including both condo and rental.
The image in Figure 2 is an aerial illustration representing a conceptual rendering of the future redevelopment of Downtown Columbia. The existing mall remains central but it will be surrounded with new mixed-use neighborhoods to be built around it over the next 20 to 30 years.
In the discussions that led to the approval of the Downtown Columbia Plan the question of school needs arose. The minutes of the Board of Education meeting on December 17, 2009 indicate that the Board members agreed that it would be prudent to expect a minimum of one school site for the Downtown Columbia development. On the other side of that concern was a belief that the downtown units would be of a higher value and incorporated into a mixed-use community and therefore tend to attract occupants with fewer children. Some have cited comparable developments in Montgomery County and Northern Virginia, where pupil yields are fairly low. Pupil yields in the existing apartments in Downtown Columbia are also very low, but at the time it wasn’t possible to be certain what the pupil generation rates would be for the new development, so decision making checkpoints were put into the Plan stipulating further analysis.
when measurable yield data became available during the initial construction phases. A further component of this perspective is that the Rouse Company had provided nearby school sites in the early stages of development in Columbia several decades ago which are still available to serve enrollment growth with new schools.

The approval of the Downtown Columbia Plan included adoption of timed or triggered commitments called Community Enhancements, Programs, and Public Amenities (CEPPAs). The CEPPA relevant to the school system is #17 which states, “GGP shall, if deemed necessary by the Board of Education, reserve an adequate school site or provide an equivalent location within Downtown Columbia.” This CEPPA must be satisfied by the Downtown Columbia developer prior to the approval of the site development plan for the 1,375th new residential unit. (25 percent of the total 5,500 units)

In anticipation of CEEPA #17, the Educational Facilities section of the Downtown Columbia Plan first calls for the HCPSS and Department of Planning and Zoning (DPZ) to study all available options for school system needs and characterize the best options for a range of possible pupil yields in a Columbia Town Center School Analysis. This analysis, which is provided here, must be approved by the Board of Education. Later, when 10 percent of the new residential units planned for Downtown Columbia (550 units of the total 5,500) are built and occupied, the Plan stipulates that HCPSS will consider updated enrollments and, subject to Board of Education approval, select the most appropriate yield ratio and associated option outlined in the Columbia Town Center School Analysis for implementation. This is followed by the application of CEPPA #17 stated above at the 25 percent unit threshold.

Since the Feasibility Study is a long-range planning document, it is well suited to host this Columbia Town Center School Analysis as an addendum. The goal of this analysis is to lay out the options for dealing with a range of enrollment growth estimates associated with Downtown Columbia development.

II. Current Development Status in Downtown Columbia

Construction has begun in Downtown Columbia in the Warfield neighborhood adjacent to the Columbia Mall. A 380 rental apartment complex known as The Metropolitan (Figure 3) is currently being built and is expected to be completed and ready for occupancy at the end of 2014 or early 2015. This mixed-use building also includes retail space on the ground floor. There are two other mixed use buildings still under plan review in the Warfield neighborhood that will be located adjacent to this first building. One of these buildings will include 267 residential units and the other 170 residential units. Both will also include retail space on their ground floors. It is anticipated that these two buildings will be ready for occupancy in 2017. The total for all three buildings includes 817 residential units.

1 General Growth Properties was the successor to the Rouse Company. The land development unit was later divested and now called Howard Hughes Company.
A second Downtown Columbia neighborhood, called The Crescent, is also at the beginning of the planning stages. The Neighborhood Design Guidelines for this project just recently went to the Department of Planning and Zoning’s Design Advisory Panel for initial review in May 2014. The Final Development Plan (FDP) for this neighborhood was recently submitted to DPZ in the first week of June. This FDP includes 2,300 residential units with construction phased over the next 10 years. Site development plan approvals, the last plan approval stage required prior to the issuance of building permits, for the various portions of The Crescent neighborhood will then be submitted for review.

In addition to development in these two neighborhoods, there is a 160 unit residential condo building planned in The Lakefront neighborhood. This building was known as the WCI Tower, and was approved back in 2006, but faced a lengthy appeals process and the company has since undergone bankruptcy. There is now a new owner of that site, which is now referred to as Little Patuxent Square. In addition to the residential units, Little Patuxent Square also includes office and retail space. Exact timing of construction of this building is currently uncertain. This plan
is not included in the 5,500 units given it had been grandfathered prior to the adoption of the Downtown Columbia Plan.

Other recent development activity in Downtown Columbia, including recently completed, under construction, or in the planning stages include the redevelopment of Merriweather-Symphony Woods, a retail expansion in The Mall, the Merrill Lynch Building renovation, the Howard Hughes headquarters building renovation which will include Whole Foods and a fitness center, the renovation of Clyde’s Restaurant, and the addition of the new Petit Louis Bistro restaurant. All of these projects do not contain a residential component, but clearly show that the redevelopment of Downtown Columbia is well under way.

III. Existing Facilities

A. Running Brook Elementary School

Running Brook ES is located at 5215 West Running Brook. This school was constructed in 1970 and has been renovated three times since then to maintain the facility, increase capacity, and respond to changes in program delivery. The current capacity of the facility is 405 seats (K–5), with separate space dedicated to Prekindergarten and early childhood programming.

Figure 4

An aerial view of Running Brook ES as presently configured is shown above. The project includes a cafetorium expansion in the front and a two-story classroom addition in the rear as shown in the pictures to the right (photo from pictometry, illustrative drawings from SMG Architects).
On September 30, 2013, the annual official enrollment report submitted to the state reported 462 students in Grades K–5 and 30 students in Prekindergarten which represents significant overcrowding based upon the current capacity of 405 students. A systemwide analysis of school facilities\textsuperscript{2} conducted in 2009 determined that this facility possessed about 66 percent of the net square footage required by the 1994 elementary educational facility specifications. The required educational program is being delivered at this facility with the aid of six relocatable classroom facilities, but additional permanent capacity was necessary.

A $6.2 million dollar addition to Running Brook ES is underway to address the existing deficiencies and continued population growth in the Columbia West school region. The project will provide an estimated 100 seats of additional classroom space by adding a two-story classroom addition, a cafetorium expansion, and additional core infrastructure space necessary to operate effectively as a larger school. This expansion will also improve the utility and effectiveness of the existing academic support spaces. As reported in the monthly construction report presented to the Board of Education this past April, the project was approximately 34 percent complete and will be ready for occupancy in August 2014.
Downtown Columbia is assigned to Running Brook ES. The Downtown Columbia neighborhoods are shown in different colors for reference and the balance of the Running Brook ES attendance area is shown in yellow. Other adjacent school attending areas are shown with a blue outline.
The Running Brook ES attending area is presently made up of 70 percent multi-family housing of either condos or rental apartments. The balance of existing housing stock is 20 percent town home and 10 percent single-family detached. The only new units in the Running Brook ES attendance area will be those in the Downtown Columbia Plan.

**B. Wilde Lake MS**

Wilde Lake MS is located at 10481 Cross Fox Lane. The school is set in a campus with Wilde Lake HS adjacent to the Wilde Lake Village Center. This single-story school building with masonry exterior wall construction was constructed in 1969 with an open classroom design. The school has been renovated two times since then to maintain the facility and respond to changes in program delivery. The current capacity of the facility is 467 seats (Grades 6–8).
Downtown Columbia is assigned to Wilde Lake MS. The Downtown Columbia neighborhoods are shown in different colors for reference and the balance of the Wilde Lake MS attendance area is shown in yellow. Other adjacent school attending areas are shown with a blue outline.
An aerial view of Wilde Lake MS today is shown above left. HCPSS considered expanding the school during a renovation but the Board of Education adopted a plan to replace this school with a new building on the same site and then raze the existing building. The picture to the right illustrates the adopted school replacement strategy with the new building set in the rear of the site. Parking, circulation and playfields for the new building would be built where the existing building is now sited (photo from pictometry, illustrative drawing from TCA Architects).

On September 30, 2013, the annual official enrollment report submitted to the state reported 546 students in Grades 6–8. A system wide analysis of school facilities\(^3\) determined that this facility possessed about 77 percent of the net square footage required by the 1994 middle school educational facility specifications. The required educational program is being delivered at this facility with the aid of four relocatable classroom facilities. The June 2014 Feasibility Study indicates that when the significantly larger Wilde Lake MS replacement school is completed in 2017, it will open at near capacity.

The Wilde Lake MS attending area is presently made up of 51 percent multi-family housing of either condos or rental apartments. The balance of existing housing stock is 21 percent town home and 28 percent single family detached. Very few new single family or town home units are anticipated and all of the new residential communities of Downtown Columbia like Warfield will feed into Wilde Lake MS. The new multi-family development at Wilde Lake Village Center is also included in the projection. At the “build-out condition” when all anticipated development is built, the attending area is projected to consist of 70 percent multi-family units.

\(^3\)Gilbert Architects Inc. August 2008 and May 2013
C. Wilde Lake High School

Wilde Lake HS is located at 5460 Trumpeter Road. This school was originally constructed in 1971 and was replaced in 1996. The current capacity of the facility is 1,424 seats (Grades 9–12). On September 30, 2014 the annual official enrollment report submitted to the state reported 1,259 students in Grades 9–12. The facility is not overcrowded per rated capacity at this time, and was built to the same prototype design standards as many of the HCPSS’s newer high schools. Wilde Lake HS is projected to remain under 110 percent capacity utilization until 2018 based on the current feasibility study.

Figure 9

Downtown Columbia is assigned to Wilde Lake HS. The Downtown Columbia neighborhoods are shown in different colors for reference and the balance of the Wilde Lake HS attendance area is shown in yellow. Other adjacent school attending areas are shown with a blue outline.
Figure 10

An aerial view of Wilde Lake HS today. Fields are shown in the foreground with the school in the center of the picture. Wilde Lake MS is not in view but located to the left. The Wilde Lake Interfaith Center is the building with the darker roof in the background. To the left of that is the Wilde Lake Village Center and the indoor aquatics facility (photo from pictometry).

The Wilde Lake HS attending area is presently made up of 44 percent multi-family housing of either condos or rental apartments. The balance of existing housing stock is 28 percent town home and 28 percent single-family detached. No new single-family or town home units are anticipated and all of the new residential communities of Town Center like Warfield will feed into Wilde Lake HS. The new multi-family development at Wilde Lake Village Center is also included in the projection. At the “build-out condition” when all anticipated development is built, the attending area is projected to consist of 59 percent multi-family units.

D. Other Facilities

Other elementary facilities in the Columbia West area include Bryant Woods ES, Clemens Crossing ES, Longfellow ES, and Swansfield ES. With Running Brook ES, these schools serve
the Columbia West region. The combined capacity of the Columbia West elementary schools will keep this region below 110 percent utilization until 2019 based on the current feasibility study. Like Running Brook ES the other facilities are significantly smaller than the newer 600 student prototype school design. They have limited room for expansion and are using relocatable classrooms. A comprehensive renovation of Longfellow ES renovation is under way (scheduled to be completed in August 2015) and a renovation and 100-seat addition for Swansfield ES is in the planning stages.

The elementary schools in Oakland Mills Village are nearby but on the east side of MD 29. They include Talbott Springs ES, Thunder Hill ES, and Stevens Forest ES. These schools are all near or within target utilization and cannot be used to balance schools in West Columbia.

Harpers Choice MS is the only other middle school in the Columbia West region and it is projected to exceed 110 percent capacity utilization in 2015 based on the current feasibility study. The combined capacity of the Columbia West middle schools will be above 110 percent utilization next school year. The HCPSS owns a school site which is located at Marriottsville Road and Rt. 40 that could someday provide relief to the Columbia West region if a new middle school were opened at that site in the future, but there is no funding placeholder in the capital improvement program at this time.

As noted before in this report, both facilities are smaller than is expected in the 1994 educational specification. After installations planned this summer, the region will host 38 relocatable classrooms, providing approximately 525 additional seats of temporary capacity. While about half of this capacity is intended to provide swing space during the renovation of Running Brook ES and replacement of Wilde Lake MS, the rest helps off-set buildings built to older designs before current programming needs were anticipated.

Wilde Lake HS is the only high school serving Columbia West. The nearest available high school capacity exists at River Hill HS and Oakland Mills HS. There are no present plans for redistricting between these schools.

IV. Vacant Sites

A. Faulkner Ridge

Faulkner Ridge is located at 10598 Marble Faun Lane. Faulkner Ridge was one of the early Columbia school sites and opened in 1969. The school was closed in 1983 due to low enrollment. After the school was closed, administrative functions were moved into the building and it was used in this way until 2010. The building is currently being used for storage. If the site were used for a school again, the existing building would need to be replaced with a school that meets current educational specifications.
The Faulkner Ridge school site is a part of the neighborhood center. Rouse Company planning diagram of neighborhood center.

The site remains an excellent location for a future school. The Rouse Company planned schools as part of its vision for neighborhood centers and the other two Wilde Lake neighborhood centers host operating schools (Running Brook ES and Bryant Woods ES). The diagram above on the right shows the land use components of the neighborhood center which all remain except the store which was converted to a day care center. This site is within a mile of the center of Downtown and is closer to Warfield, The Mall, and the northern part of The Lakefront than sites in Hawthorn and Clary’s Forest (described further below). The 2011 Feasibility Study demonstrated that opening a school at the Faulkner Ridge site in 2019 or later could be done with redistricting to include nearby schools, Bryant Woods ES and Swansfield ES. With some local redistricting, a school with the HCPSS’s current educational specification would serve to keep utilization within target through the middle of the next decade.

B. Hickory Ridge Village Sites

Like Wilde Lake Village, Hickory Ridge Village was designed with three neighborhood centers, Clary’s Forest, Hawthorn, and Clemens Crossing. Unlike Wilde Lake’s three neighborhoods, only one of the Hickory Ridge Village neighborhood centers have been used to build a school, the Clemens Crossing ES location. Two others exist and they are in reasonable proximity to the Columbia Downtown.
A school was never built in the Hawthorn Neighborhood Center. HCPSS owns the field and forested area behind the community center which is at 6175 Sunny Spring The site is approximately ten acres in size and about 1.5 miles from the center of Downtown Columbia. The land is made available for community use, as are all operating schools.

A school was never built in the Clary’s Forest Neighborhood Center. The vacant land is adjacent to the community center which is at 11615 Little Patuxent Parkway. The site has not been transferred to the HCPSS and is currently owned by Howard Research and Development, a subsidiary of Howard Hughes. The site is 9.75 acres in size and about 2.5 miles from the center of Downtown Columbia. The site is unused.
V. Projections

A. Elementary School Level Enrollment Projections

The June 2014 Feasibility Study report provides individual projections for each school in the system. The projection model and methodology used in the report is based on historic cohort survival ratios, and projects the number of students that “survive” from one grade level (cohort) to the next. Then the effects of new housing yields and the net effects of resale of existing housing stock and apartment turnover are added to the projection.

The projection indicates that Running Brook ES will remain below 110 percent capacity utilization until 2016. Enrollment will grow from the present enrollment of 492 to a peak of 1,263 in 2035. The methodology is based on cohort survival but housing factors like the effects of new housing yields or the net effect of the resale of existing housing stock are also included.
The model starts with a cohort of students being born and then increases or decreases the cohort based upon grade succession and housing factors at each grade based upon school history. The effects are reapplied to the rising cohort each year.

Some parameters are specifically relevant to multi-family. Existing housing is used to calculate net student yield from turnover of apartments from one lease to the next. DPZ provides a projection of total future housing spread over future years for each school attending area. The projected number of units is multiplied by the yield for new housing of that in each year of the projection to get yield from new housing. Net yield increases as units accumulate in accord with the DPZ projection. The figure below helps to show all factors in a stacked format contrasting two years.

Figure 15

Having considered the factors in the projection, this study seeks to adjust the factors for multi-family housing based upon observed differences found in the standing yield study. In the figure below the factors are entirely removed. It can be seen that growth coming from other factors is much less intense.
The future housing number comes from a housing projection developed by the Department of Planning and Zoning. This projection takes into account all development allowed by the General Plan including recently approved projects, development plans that are currently being reviewed, and future development based on zoning capacity. The accumulation of future units is guided by known phasing and what would be permitted further in the future annually under current growth management law. As it happens, the Running Brook ES attending area housing projection is only made up of the Downtown Columbia development. It is important to also remember that other effects are modeled in the projection like births and survival rates but the specific effects which are relevant to the projected development. That can be illustrated by removing them from the projection and graphing the difference.
The scenario with new multi-family units shows enrollment is expected to double in the next decade and triple in the following decade. Removing the future multi-family development from the model produces modest enrollment growth of 7 percent in the next decade and 11 percent in the following decade.

The above chart shows enrollment but when the projection is presented in the feasibility study it is expressed as capacity utilization. This measure shows the effect of the enrollment growth on existing capacity. The feasibility study includes a planned 100 seat addition to Running Brook ES scheduled to open in August 2014 which would raise the capacity to at least 505 seats. The feasibility study indicates capacity utilization will be almost 200 percent in a decade and peak at 250 percent utilization. Removing the Columbia Town Center future development results in projected capacity utilization no higher than 108 percent. This scenario could be easily accommodated by the existing building with the new addition.

The additional capacity needed based on the above analysis is 600 seats to serve the Running Brook attending area alone. This capacity happens to match the current educational specification of a school like Ducketts Lane ES. No such school is presently in the capital improvement program (CIP). If such a school were added, the combined capacity would keep capacity utilization under 115 percent throughout the projection. This is illustrated in Figure 18.
B. Middle School Level Enrollment Projections

The projection indicates that the Wilde Lake MS replacement school will remain below 110 percent capacity utilization until 2019. Enrollment will grow from the present enrollment of 546 to a peak of 1,104 in 2035.

The relevant new housing yields and the net effect of the resale of existing housing stock are incorporated as well as the accumulation of future units projected by DPZ for this attendance area. These include Downtown Columbia and Wilde Lake Village Center. While this report is focused upon Downtown Columbia, the Wilde Lake Village Center phasing is only a minor contribution. The effect of Downtown Columbia can be illustrated by also removing that from the projection and graphing the difference.
Figure 19

The line “No New MF” models the enrollment projection with the additional proposed multi-family units of Downtown Columbia as it is in the feasibility study. This is contrasted with a no build scenario. Wilde Lake Village Center units are not removed but with only 250 units the distinction is minor anyway. The additional 5910 units will be added to 8493 units presently in the attending area.

The scenario with new multi-family units shows enrollment is expected to increase by 38 percent in the next decade and will have nearly doubled by the following decade. Removing the future multi-family development from the model produces modest enrollment growth of 6.5 percent in the next decade and 11 percent in the following decade. The feasibility study indicates capacity utilization will be almost 134 percent in a decade and peak at 177 percent utilization. Without the Columbia Town Center development capacity utilization would be no higher than 116 percent. Figure 20 illustrates capacity needs with and without Columbia Town Center Development.
The grey line represents the capacity of Wilde Lake MS with the step up when the replacement school opens. The blue line represents Wilde Lake MS enrollment without future multi-family, which is nearly all Downtown Columbia. The red line models Wilde Lake MS growth with this development. The planned capacity serves projected enrollment well through the end of the decade.

For the next few years growth can be accommodated by the replacement school with some temporary capacity. The ultimate additional capacity which is needed is 440 seats. It is reasonable to believe about 150 seats could eventually be added to Harpers Choice MS but this falls significantly short of the ultimate needs for capacity. HCPSS owns a school site which is located at Marriottsville Road and Rt. 40 (between the Harpers Choice MS and Mount View MS attending area) that could someday provide relief to the Columbia West region if a new middle school were opened at that site in the future, but there is no funding placeholder in the CIP at this time.

C. High School Level Enrollment Projections

The projection indicates that Wilde Lake HS will remain below 110 percent capacity utilization until 2020. Enrollment will grow from the present enrollment of 1,255 to a peak of 2036 in 2040. New housing yields and the net effect of the resale of existing housing stock are incorporated in the projection. As noted above, the accumulation of future units projected by DPZ for this attendance area includes Columbia Town Center and Wilde Lake Village Center.
The line “With New MF” models the enrollment projection with the additional proposed multi-family units of Downtown Columbia as it is in the feasibility study. Wilde Lake Village center units were not removed but with only 250 units the distinction is minor anyway. The line “No New MF” models a scenario where no multi-family units are built.

The scenario with new multi-family units shows enrollment is expected to increase by 30 percent in the next decade and 47 percent after the following decade. Removing the future multi-family development from the model produces modest enrollment growth of 19 percent in the next decade and 22 percent in the following decade.

The feasibility study indicates capacity utilization will be almost 122 percent in a decade and peak at 146 percent utilization. Without Columbia Town Center, development results in capacity utilization no higher than 114 percent. Figure 22 illustrates capacity needs with and without Columbia Town Center Development.
Figure 22

For the next few years growth can be accommodated by the existing school, but the ultimate additional capacity needed is 666 seats. The high school educational specification would not readily support this size addition. The best way to address this need would be in the context of opening HS #13 which is shown later in the CIP.

VI. Alternative Pupil Generation

The projected needs based upon the model in the feasibility study seem urgent. A continuing theme since the plan amendment was adopted has been a belief that the downtown units would be of a higher value and built within a mixed-use environment and, therefore, tend to attract occupants with fewer children. DPZ staff has cited comparable developments in Montgomery County and Northern Virginia, where pupil yields are fairly low. For this reason the feasibility study projections have been questioned because it relies upon countywide data which may not include comparable units.

The current enrollment projection method was developed in 2003 in-house on the heels of a 2002 consultant produced projection developed by the DeJong Richter firm. Staff observed that the consultant was using a standard cohort survival methodology. The best advantage to cohort survival is that the method is rooted in student data, the data staff knows well and can control. The cohort projection methodology also includes birth data to help determine new kindergartener’s entering the system. Demographers also modify cohort survival with other components like housing effects. The HCPSS methodology modifies the cohort projection with additional considerations including net new students generated from future residential development and resale and rental turnover of existing homes.

Residential development can yield students differently. Different age families are attracted to different types of units. The HCPSS method treats all multi-family units the same. This means...
that a variety of units including condos, tall elevator buildings, and walk-up garden rental apartments are all averaged into one yield. Combining the types was a reasonable design for the model because the majority of housing in Howard County is single family (detached or town home) and multi-family pupil generation rates are so much lower than that of other units that the distinctions didn’t really matter. Furthermore, the HCPSS did not have detailed information of the type of multi-family housing.

In order to develop a pupil generation rate, enrollment history is required. The HCPSS collects five-year histories for yields from new apartments and net yield from turnover of existing apartments. Sometimes at the school district level, however, there is not any new apartment construction yield history in the past five years. In some cases it is a school where there are no multi-family units. In other cases it is a school where multi-family units exist but are older than five years. In these circumstances countywide rates for new multi-family construction are used. For this reason for the Downtown Columbia area in the feasibility report the projection is using countywide averages of new multi-family yields. The net apartment turnover and condo resale measures do use local school district data because it is available. The use of countywide new construction yield data has been questioned in modeling Downtown Columbia on the theory that multi-family in other areas may generate at different rates.

As an alternative to utilizing countywide averages, staff concluded it was necessary to analyze the potential of new development in Downtown Columbia by looking at more detailed yield data from existing multifamily units in Howard County. Staff knows from yield studies conducted by nearby jurisdictions\(^4\) that pupil generation rates tend to vary by the number of stories and condo vs. rental. They are generally lower for condos and high rise buildings and higher for rental units and lower rise garden style structures. So staff analyzed all the multi-family units in Howard County and classified them by four types: 1) 1 to 4 story rentals, 2) 5 stories and higher rentals, 3) 1 to 4 story condos, and 4) 5 story and higher condos. Department of Planning and Zoning (DPZ) staff developed this information in the form of a GIS layer.\(^5\) The sample was countywide and it included a total of 25,538 multifamily units. Three quarters of the units were apartments and one quarter were condos, with most units being in buildings of four stories or less. Only two percent of the sample was apartments of five stories or more. Less than one percent of the sample was condos of five stories or more. These smaller samples are probably less significant but the goal of this analysis was to examine local data. Staff took this data and geocoded ten years of student enrollment history to the polygons and summarized the results to acquire rates by multi-family type.

### A. Elementary School Chart

The following graph shows standing pupil generation rates by multi-family housing type over time for the elementary level. Low-rise rental units produce the most students and high-rise condo units produce the least. This study shows the same trend staff has seen in the feasibility study projection that multi-family pupil generation rates have been increasing.

---

\(^4\) Alexandria, VA, Baltimore County, MD, Fairfax County, VA and Montgomery County, MD.

\(^5\) They have not yet been able to do the same for single family housing.
Since the Feasibility Study projection for Running Brook ES projection did not have new multi-family units in the last five years, staff chose the countywide average, which per the HCPSS’s methodology, is done for all school districts that do not have any recent history from new development. This countywide rate was 0.101 (elementary students per unit). The standing yield study suggests in recent years that low-rise apartments exceed this average and low-rise condos approach this average. High-rise apartments are lower at about 0.07. High-rise condos are close to 0.04, but it should be noted that there is only a small sample of these types of units. The next report is required when 10 percent of the Downtown Columbia units have been constructed and occupied. All are planned to be high-rise rental and condo so this will provide a larger sample to determine pupil yields.

**B. Middle School Chart**

The following graph shows pupil generation rates by multi-family housing type over time for middle schools. The middle school pupil generation rates are lower as would be expected since it consists of only half as many cohorts. Staff also expects that as families’ children age they tend to seek larger housing units which are often townhomes or single-family detached units. Similar to elementary school students, low-rise rental units produce the most middle students and high-rise condominium units produce the least.

This study supports increasing utilization rates. In the feasibility study staff has chosen the countywide average for Wilde Lake MS because there were no new units in the last five years. This rate of 0.045 is only half the low-rise apartment standing yield rate and closer to existing rates for high-rise apartments and condos.
C. High School Chart

The following graph shows pupil generation rates by multi-family housing type over time for high school. Most high school pupil generation rates are lower than elementary as would be expected since it consists of only two thirds the number of cohorts. Low-rise rental units again produce the most students and high-rise condo units produce the least.

This study supports increasing utilization rates. In the feasibility study staff has chosen the countywide average for Wilde Lake HS because there were no new units in the last five years. This rate of 0.036 would not be out of place on this graph where the rates are ranging between 0.005 and 0.09.
A number of conclusions can be drawn from this standing yield study. The first is that the ten-
year standing yields by unit type are not dramatically different from the combined multi-family
yields presently used in the HCPSS’s methodology. Combining the unit type does not appear to
have been detracting from the results. It is also clear from the data above that high-rise rental and
condo units have lower yields than low-rise units.

The concern that future yields are higher than the yields from the new units that will be built in
Downtown Columbia has validity. Most existing multi-family units in Howard County are low-
rise walk up apartments and very few are high-rise five stories or higher. Prices were not studied
but it is reasonable to assume many of these existing units are modest in price, making them
affordable to young families. In contrast, the first multi-family project in Downtown Columbia,
The Metropolitan, will be a five and six story complex including a parking garage, interior
clubhouse, and courtyard with pool, and have retail on the first floor. Potential units and rents
were reported in the Baltimore Sun to be, “lofts, one-, two- and three-bedroom apartments
ranging from $1,500 to $2,800 in monthly rents.”

There are some problems with adopting the hypothesis that all 5,660 Downtown Columbia units
over the next twenty years will all be high end units. This is not what has occurred in the last
fifty years. In the early years of Columbia, early advertisements appealed to business people in
the New York City market who might relocate their companies to Columbia and chose to live in
the new community as well, but luxury apartments were not specifically referenced.
Furthermore, following this initial marketing effort, the economy stagnated under the burden of
inflation. Ads in Columbia for apartments and condos then emphasized good price and

---

6 Luke Lavoie, “Developers break ground on $100 million apartments in downtown Columbia.” Baltimore Sun,
February 11, 2013
convenience, not luxury. The result in Columbia has many appealing features but it is not equivalent to places like Bethesda Row in Montgomery County or the features cited for The Metropolitan. More like The Metropolitan are likely, but it is hard to say over a long span of time what the market will bear.

Another factor to consider is the rising trend for families to live in multi-family units. While higher income families typically choose single family options, demographers are finding the next generation to rear children, millennials (18-33) are less inclined to marry and more inclined to rent. Should they retain these preferences as they begin to raise children, a supply of new high quality apartments in a county with a well-regarded school system may be an attractive draw.

Successful communities have unique features that attract new residents. The school system is a primary attraction in Howard County for new residents. New housing in Downtown will initially be marketed to singles and empty nesters. Ideally their presence will sustain new investments in Downtown businesses and other activities. The result could be a community which is more desirable to a wider range of new residents, including families. This will probably influence later phases of Downtown. There is no requirement that Howard Hughes Company build only luxury apartments and no prohibition on families.

There are a variety of avenues for future analysis. Given the available data and the task at hand it seems best to try to apply these findings to the current projection model and see if that changes staff’s perception of future needs. The sample for high-rise apartments and condos that currently exist in Howard County is too small to draw statistical conclusions. This leaves the contrast between low-rise apartments and low-rise condos. The existing stock of low-rise condos is definitely more luxury in nature than the existing stock of low rise apartments. So it would seem that low-rise condo rates are a reasonable proxy for future luxury units which may be rental or condo. The average pupil generation rate over the 10 year standing yield analysis in this study for low-rise apartments is 0.136 elementary students per unit. The average pupil generation rate is half of that for low-rise condos at 0.068 students per unit for all instructional levels. In comparison the average low-rise condo rate is lower at the elementary and middle level but it is higher for high school. All values are summarized in the following table:

In examining the generation rates recorded in other communities, staff took notice of a Baltimore County report which included a survey of pupil generation rates conducted in 2009 by the

---

8 Pew Research Center, Young Adults After The Recession Fewer Homes Fewer Cars Less Debt, (Washington DC: February 21, 2013)
9 Baltimore County Public School System, Pupil Yield Study, (Towson, MD: 2009)
Baltimore Metropolitan Council and a residential forecast study in 2012 by the Sage Policy Group / Cropper GIS. In the 2009 study multi-family units were broken out into owned and rented. Geography is listed by election district. The 2012 study focuses on Districts 2, 3, & 4 because this is an area of significant residential growth. District 2 and 4 incorporate the multifamily development near the Owings Mills Mall which is relevant to a discussion of Downtown Columbia future growth. These areas have some similar existing development and plans for town center redevelopment. The following table presents the multifamily rates for these two districts:

Montgomery County, Maryland is an adjacent jurisdiction with a variety of multi-family housing types of different ages. They track generation rates by school level, height of building, and region.

Figure 26  
Montgomery MCPS Student Generation Rates 2013

North includes general “upcountry” like Clarksburg. The East includes “down county” like Silver Spring. The Southwest includes Bethesda – Chevy Chase. Note that Southwest values are generally lower.

While the existing pupil generation rates tend to compare to Montgomery County’s North and East regions, the types of housing proposed in Downtown Columbia may have comparable examples in the Southwest region. These lower rates are in the same range as the observed standing yield in Howard County. One of the more urbanized areas in the region which possesses a mixture of multi-family housing types is Alexandria, Virginia. Most units predate 2000 and their studies show that pupil generation rates increase with the age of the facility.
Over 85 percent of the multifamily units in Alexandria were built before 2000 but there is a wider mix of types than in Columbia which helps to characterize likely future Downtown Columbia units.

Note: Housing Authority and Cooperative Garden apartment yields are removed. These types happened to have much higher pupil generation rates but they are unlikely in Howard County.

In developments which were built in 2000 and later, there are some specific circumstances worth noting.

Future Downtown Columbia units will probably fit the mid-rise apartment category. Existing units mostly fit the garden apartment with a few garden and mid-rise condos.
To put this selected data in context the following chart places the observed Howard County standing yield rates in the context of selected rates from Baltimore County, Montgomery County, and Alexandria, Virginia. Since elementary rates are the highest, they are presented to simplify the number of values on the chart.

The low-rise condo rate for Howard County is below all apartment rates except high-rise apartments in Alexandria. Notably, the rate is close to the mid-rise apartment rate in Alexandria. It is fairly similar to the condo rates in the other areas.

While there is no perfect way to model future development in Downtown Columbia, these values provide some context. Choosing the standing yield rate measured for Howard County condominiums as a proxy for future multifamily units in Howard County seems to be a reasonable choice given the pupil yield performance in other jurisdictions shown in Figure 29. One of the better comparisons in this chart for luxury units above four stories seems to be the Montgomery County Southwest region (Bethesda Chevy Chase area). Howard County’s condo rate is higher than their high rise rate of 0.042 (5 stories or higher) but it is lower than their low rise rate of 0.075. When the next report addresses conditions following 10 percent build out of Downtown Columbia a slightly more conservative choice like 0.042 could be warranted, if staff were to use Bethesda Chevy Chase area as a guide. In the charts that follow the projection is adjusted with the low rise condo rate replacing the countywide multi-family yield rate at the elementary and middle school level. This rate is also proportionally applied to future year net yield from apartment turnover. Since the low rise condo rate is actually lower than the countywide multifamily average at the high school level no change is made. However the high school chart is adjusted for the elementary and middle school rising student effects.
D. Elementary Modification

The following graph shows enrollment projections at Running Brook ES under two scenarios. The red line shows the projected enrollment from the feasibility study projection, which uses the countywide average rate of 0.101 at the elementary school level. The purple line indicates the modification which substitutes the low rise condo rate (0.064) rather than the countywide multi-family yield rate. This rate is also proportionally applied to future year net yield from apartment turnover, reducing yield rates by a third. For reference current capacity is shown in blue and capacity for a new school meeting current education specifications is shown in a green line.

![Enrollment Projection Scenarios – Running Brook ES](figure30)

The projections shown above provide a range of possible outcomes useful in planning for what choice may be considered after 10% of the units are constructed and occupied, and yields can be evaluated. The first insight seems to be that one school site is definitely necessary for elementary needs.

E. Middle Modification

Figure 31 shows enrollment projections at Wilde Lake MS under two scenarios. The red line shows the projected enrollment from the feasibility study projection. The purple line indicates the modification which substitutes the low rise middle school condo rate (0.032) for the reasons discussed after figure 29, for the countywide multi-family yield rate (0.045). This rate is also proportionally applied to future year net yield from apartment turnover, reducing yield rates by about 30 percent. For reference, Wilde Lake MS capacity is shown in blue with a change reflecting the Wilde Lake MS replacement.
At the middle school level the modification to the trend suggests that a combination of redistricting and expansion of a nearby school like Harpers Choice MS will accommodate growth over the next ten years. The longer term need can be rationalized into a fraction of land using HCPSS Policy 6000 Site Selection and Acquisition as a guide. This policy suggests a desirable size in usable acres for a middle school beginning at 20 acres. The long-term need for approximately 300 seats is 0.45 the prototype middle school capacity of 662, or 20 acres multiplied by 0.45 is 9.1 acres. Alternatively the fraction in average middle school floor area is approximately 25,128 square feet.

F. Impact to High School Projection

The following graph shows enrollment projections at Wilde Lake HS with the Wilde Lake MS and Running Brook ES feeds reduced to reflect modified pupil generation rates. Interestingly the standing yield rate for low rise condos exceeds the current average pupil yield rates for multi-family countywide. It is too early to tell if this is an indication of a trend. For this reason the new apartment yield rate was not adjusted nor was there a change to the future year net yield from apartment turnover. A change still occurs because of the effect from the feeds that were subjected to modification. Also note that the larger attending area and capacity makes any high school less sensitive to one specific development.
At the high school level the modification of the feeders lowers the long term enrollment trend. Temporary capacity could be considered at Wilde Lake HS in the short term, and as plans for a new high school relieving the Northeast and Southeast Regions evolve, a plan could consider redistricting options.

This need can be rationalized into a fraction of land using HCPSS Policy 6000 as a guide. This policy suggests a desirable size in usable acres for a high school beginning at 30 acres. The long-term need for approximately 450 seats is 0.31 the average high school capacity of 1,429, or 30 acres multiplied by 0.31 is 9.4 acres. Alternatively the fraction in average high school floor area is approximately 70,000 square feet.

### VII. Options for School System Needs

The conventional options for HCPSS to resolve K–12 capacity needs are temporary capacity, expansion of existing buildings, new buildings, and redistricting.

#### A. Temporary Capacity

Temporary capacity is already being used at the elementary and middle facilities in this area to support current academic programming needs. There are some disadvantages to temporary capacity, including negative impacts to parking and recess space, increased maintenance requirements, and security vulnerabilities. The advantage to temporary capacity is that it allows the system to react to short-term needs at a relatively low cost. System wide temporary capacity needs are evaluated annually and may be adjusted to accommodate the needs of the Columbia West region. Policy 6010 School Attendance Areas dictates that temporary capacity may not count toward capacity in any HCPSS capital planning or redistricting feasibility studies.
B. Construction of Additions

Construction of new wings to existing schools has historically been done to address enrollment growth, but only to the limits of the largest educational specification at that instructional level (788 students in elementary, 700 students in middle, and 1,400 at the high school level). Regardless of these practices, the smaller Columbia elementary buildings and sites are only capable of a limited amount of expansion. Specifically the Running Brook ES site will have reached the limits of its core capacity following the completion of the current addition. Some of the other schools in this region may be able to host small additions, but these improvements will not significantly address the long term needs.

C. New Schools

This report underscores the need for a new elementary school and fractions of both a middle and high school. This need is calculated after the model was modified to suppress pupil generation rates to better capture proposed development. Past history has proven the Faulkner Ridge site can serve the elementary need with a new school, and if capital funding for construction is made available. Obtaining land bank sites that are consistent with the secondary needs is an option. Another option would be for the developer to provide Class A office space which could be used for either administrative offices or regional Pre-K centers.

D. Redistricting

Redistricting can access available capacity within the system by shrinking the attending area of crowded schools and enlarging the attending area of schools with available capacity. Future feasibility studies can examine redistricting as needed. The weakness of redistricting plans affecting Columbia is that the available capacity may be too distant to take advantage of.

VIII. Recommendations

1. **Prepare to monitor enrollment in Columbia Downtown** – A follow up report is due when 10% of units are permitted and occupied. This report may require an additional standing yield analysis or other studies. In the interim continue to evaluate comparable growth in surrounding jurisdictions.

2. **Retain Faulkner Ridge Site** – The Faulkner Ridge site is closest to Town Center and should be considered a primary option for construction of a future elementary school.

3. **Retain Hawthorn Site** – This site is still relatively close to Town Center and a valuable location for future prekindergarten, elementary, or middle school needs.

4. **Obtain Clary’s Forest Site** – The Faulkner Ridge and Hawthorn sites alone do not resolve future needs. When middle and high school needs as fractions of typical schools were rationalized to the land requirement, they each called for a site of that size. While the Clary’s Forest site is most distant of the three sites, owning it gives HCPSS future flexibility in responding to future prekindergarten, elementary, or middle school needs.

5. **Since other tracts of land are not available, Seek opportunities for office space within a downtown building** - Approximately 35,000 square feet of space would be
equivalent to the HCPSS leased space in the Ascend One building plus Central Office staff space at the ARL building. That size space could also serve the need for regional early childhood education. Either of such uses would actually be very complimentary to the mixed use development, either bringing services to residents or patronization of retail.

**Notes:**

1. Classrooms that meet the square footage requirements set forth in the HCPSS Guidelines Manual for Renovations and Modernizations of Existing Schools dated February 2009 (i.e. a minimum of 750 s.f. for Kindergarten and a minimum of 660 s.f. for Grades 1-5) receive capacity based on the following: Kindergarten at 22 students per classroom; grades 1-2 at 19 students per classroom; and grades 3-5 at 25 students per classroom.

2. Undersized classrooms that do not meet the minimum square footage requirements do not receive capacity.

3. Temporary relocatable classrooms do not receive capacity.
